

Agentic Filesystem Research Paper

Abstract: This paper presents the design of the Agentic Filesystem, a tenant-scoped file storage and semantic search system for AI agents. The system combines file storage with vector search for document retrieval.

1. The Indexing Pipeline processes files through text extraction, chunking at 512 tokens with 10 percent overlap, and embedding.
2. Hybrid search uses Reciprocal Rank Fusion for best results.
3. Tenant isolation ensures complete data separation.
